DATASHEET

Memantine hydrochloride

Product overview

Name Memantine hydrochloride

Cat No HB0407

Alternative names Axura, Akatinol, Namenda, Ebixa, Abixa, Memox

Biological action Antagonist >98%

Description Non-competitive NMDA receptor antagonist

Images

Biological Data

Biological description

Non-competitive NMDA receptor antagonist (IC $_{50}$ = 1.25 μ M). Binds to ion channel site.

Shows low affinity but has rapid blocking and unblocking ability at the NMDAR.

Selectively blocks extrasynaptic NMDARs.

Enhances hippocampal long-term potentiation (LTP) and reverses LTP suppression.

Application notes

Improves cognitive function and shows anti-Alzheimer's activity.

The voltage sensitive NMDA receptor antagonist memantine is effective at concentrations of 10-100 μ M. In CA1 hippocampal neurons held at – 30 Mv, Hello Bio memantine (at 100 μ M) gradually inhibited evoked NMDA receptor mediated excitatory currents over time (see Fig 1 above).

#Protocol 1: Assay evoked NMDAR currents at -30 mV (used for memantine)

- NMDAR currents were recorded via whole cell voltage clamp recordings of CA1 pyramidal neurons from the rat hippocampal brain slice and evoked via a stimulating electrode placed in the CA3 region to stimulate the Schaffer collateral pathway.
- Each NMDAR current was evoked via a single square (150 μs) pulse every 10 sec at a stimulus intensity that gave a reliable NMDAR current.
- Neurons were constantly held at -30 mV and NMDAR currents recorded in response to continual bath applications of NMDAR antagonists.
- All NMDAR recordings were made in the presence of GABAA-R and AMPA-R antagonists.

Solubility & Handling

Storage instructions Solubility overview Important Room temperature Soluble in water (100mM)

This product is for RESEARCH USE ONLY and is not intended for therapeutic or diagnostic use. Not

for human or veterinary use.
